DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-4 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Haenggi et al. in view of Berglund.

Haenggi et al. teaches a method of decreasing Lipoprotein (a) by administering 7.alpha.-Methyl-17.alpha.-ethynyl-17.beta.-hydroxy-5(10)-estren-3-one, hereinafter Tibolone, to a human subject, see abstract in particular. Haenggi further teaches that Lp (a) has been shown to be a strong risk factor for coronary heart disease, see abstract.

Haenggi et al. does not particularly teach that employment of Tibolone in a method of inhibiting atherosclerosis.

Berglund teaches that Lp(a) has been implicated with an increased risk of atherosclerosis, see abstract.

Art Unit: 1617

It would have been obvious to one of ordinary skill in the art at the time the invention was made to employ Tiibolone in a method of inhibiting atherosclerosis.

One of ordinary skill in the art would have been motivated to employ Tibolone in a method of inhibiting atherosclerosis because Lp(a) has been implicated with an increased risk of atherosclerosis, and Tibolone is known to decrease Lp (a) levels thereby inhibiting atherosclerosis.
